In remote regions of Central Asia, climate is harsh, and many households depend on goats and sheep for their livelihoods. Poor livestock productivity, lack of access to markets and limited know-how, however, limits their income-earning opportunities, and they struggle with poverty.

**Key messages**

- Low productivity and lack of access to markets trap pastoralists in poverty
- Community-based breeding programs boost livestock productivity
- Value chain development link farmers to global markets, increase their incomes
Central Asian wool producers are cut off from markets and opportunities

For small producers of sheep and cashmere as well as angora goats in Tajikistan and Kyrgyzstan, international fiber markets can seem a world away. Local fiber processors, mostly poor rural women, who add value by spinning, weaving, knitting and felting, are equally cut off from these distant markets where handmade, luxury clothing and handicrafts fetch a high price.

Furthermore, the productivity of goats and sheep is extremely low, barely meeting the needs of tens of thousands of families in Central Asia, who live in harsh climates and rely on livestock production as their only source of income.

The collapse of state-run breeding programs after the breakdown of the Soviet Union has left them with poor-performing livestock and without access to new knowledge, technologies and training programs to adequately meet market standards.

Improved breeding programs increase wool quality

In 2009, scientists began collaborating with small-scale producers in Tajikistan and Kyrgyzstan. The goal was to establish innovative community-based breeding programs using selective cross-breeding and artificial insemination techniques with imported frozen semen from highly productive rams to improve the flock productivity and quality. Lab assessments of local fiber and a market study of desired yarn quality served as a basis for designing the new breeding programs.

In Tajikistan, angora goats were cross-bred with improved angora sires from Texas to produce a softer, finer fiber and double the mohair productivity compared to local goats. A community-based breeding program for cashgora goats was also established, involving over 2,500 farmers from eight villages and using Altai cashmere bucks from Russia, renowned for their higher quality fiber. The improved cashgora goats produced 15 percent more fiber compared to local goats, while the percentage of animals producing white fiber (easier to dye) increased by 20 percent.

In Kyrgyzstan, scientists helped improve sheep breeds using high quality Tian-Shan rams, which led to improved wool, along with increased yields of fiber and meat. The essentials of the breeding program were similar for each village, but operation differed slightly depending on local situations and agreements. The project also enabled more sources and greater quantities of nutritious feed.
High-quality yarn and new skills open doors to international markets

To tap into higher-end markets, scientists worked with livestock producers to develop a model for processing mohair and cashmere into high quality yarn, suitable for export. They also worked with spinners and weavers to develop new technologies for processing the yarn into finished products, designed for replication and scaling up.

A major component of the project was enhancing the skills of rural women in spinning, weaving, knitting and felting. Some 23 processing groups involving 257 women gained skills in producing luxury yarns and finished products, such as woven blankets and carpets, as well as in creating new products for international markets.

These efforts have opened doors for Tajik suppliers of mohair and cashgora yarn to two US-based companies – Knit Outta the Box and Clothroads – linking them to buyers in the US and Europe. Products like knitted hats, shawls and felt slippers have also found customers in high-end local markets in the West and are actively sold through the project’s online store, Adventure Yarns.

Global yarn markets prove lucrative business for rural women

A total of 257 women processors and 148 goat and sheep farmers, owning a total of nearly 10,000 animals, benefited from the project (as of September 2013). On average, the annual income of the Kyrgyz women increased by 2.3 times, while the monthly income of Tajik women increased by 1.3 times.

With the help of the project, more efficient processes and higher quality products are generating additional income, incentivizing all stakeholders along the value chain, many of whom are women. In Badakhshan, Tajikistan, for example, the increased demand among women spinners for combed cashmere has enabled goat keepers – also mainly women – to earn US$21 per kilogram from selling combed cashgora fiber, compared to US$2-3 per kilogram from sheared fiber they sold earlier.

The most proficient spinners of mohair yarn can now earn about US$9.40 per day – five times what they earn from low quality yarn produced for the Russian market. The more lucrative business is motivating rural women to invest their own money in the businesses. Many participate in international craft fairs to further market their products. Leaders of the processing groups have also become role models, with the capacity to empower, inspire and teach other women – and men – fiber processing and business skills.

The introduction of genetically improved sheep and goats into rural communities has served not only the purpose of improving fiber quality, but also as a catalyst for the reorganization of the Angora goat sector in the region.

The success of community breeding programs and profitable value chains has demonstrated a scalable approach to reducing poverty and food insecurity in remote regions dependent on sheep and goats. The project ended in 2013 and is now being used as a model by development organizations, such as the Aga-Khan Foundation, to replicate value chain development for greater impact in Central Asian countries.

- **SDG:** SDG 1: No poverty

The CGIAR Research Program on Dryland Systems brings together eight CGIAR Centers and numerous international, regional and national partners to engage in integrated agricultural systems research and unique partnership platforms to ensure improved food security, equitable and sustainable natural resource management and better livelihoods in the world’s dry areas. The program is led by the International Center for Agricultural Research in the Dry Areas (ICARDA), a member of the CGIAR Consortium. CGIAR is a global agriculture research partnership for a food secure future.
